

Viral Infection compared with Vaccination (modRNA)

Viral Infection	Vaccination
<p>ANTIBODIES AGAINST ALL PARTS Antibodies are produced against all parts of the virus – creating good cross immunity</p>	<p>ANTIBODIES AGAINST ONE PART Antibodies are only produced against the spike protein – leading to poor cross immunity</p>
<p>ABSORBED BY ONLY SOME CELLS Virus enters only specific cells that have a specific receptor</p>	<p>ABSORBED BY ALL CELLS modRNA is in a lipid nano particle that enables it to merge with and enter ALL cells</p>
<p>STOPPED IN PERIPHERAL SYSTEM Virus enters through the mouth and nose. The innate immune system shields the body from much of the virus</p>	<p>INJECTED INTO CORE SYSTEM modRNA is injected in <ol style="list-style-type: none"> 1. a high concentration 2. reaches all parts of the body via the blood stream </p>
<p>ATTACKED BY IMMUNE SYSTEM The virus is made of proteins, which are detected by the immune system. The immune system destroys much of the virus before it infects cells.</p>	<p>BYPASSES IMMUNE SYSTEM modRNA is not protein, so it bypasses the immune system.</p>
<p>SHORT DURATION OF VIRUS PRODUCTION Viral production ceases after a few days</p>	<p>LONG DURATION OF SPIKE PRODUCTION Spike production continues for 6 months or longer</p>
<p>NO LIPIDS PRESENT</p>	<p>LIPIDS BECOME CATIONIC These are highly toxic</p>
<p>NO SV40 PRESENT</p>	<p>CONTAINS SV40 SV40 enables foreign DNA to readily enter the nucleus – increasing mutation and therefore cancer</p>
<p>NO PLASMIDS PRESENT</p>	<p>CONTAINS PLASMID DNA Is readily taken up by bacteria in the gut microbiome – turning them into spike factories</p>
<p>NO AMYLOIDOGENIC SEQUENCES</p>	<p>AMYLOIDOGENIC SEQUENCES The modRNA contains 3 sequences that are highly amyloidogenic – they create white amyloid clots that cannot be broken down by the body, and grow until they fill the circulatory system.</p>
<p>NO GRAPHENE OXIDE</p>	<p>GRAPHENE OXIDE This forms sheets that are a single atom thick – acting like razors upon the inner walls of blood vessels. This also induces a magnetic effect.</p>

The vaccine has much wider bio-distribution, since it is injected and enters the blood stream.

The vaccine is mRNA rather than proteins, so it can escape detection by the immune system.

The vaccine merges with all cells, rather than just those with the viral receptor.

The vaccine contains several highly toxic ingredients –

1. Lipid nanoparticles that become cationic
2. SV40
3. DNA plasmids
4. Graphene Oxide

The vaccine produces a spike that has been modified to include amyloidogenic sequences. Hence the onset of amyloid clots – a completely new phenomenon since rollout began.

The vaccine induces the long term, chronic production of spike protein, causing far more damage than a temporary viral infection. It turns your body into a permanent spike factory – leading to a progressive breakdown of health, and to organ failure.
